Abstract—The purpose of this study was to determine whether there were differences in the prevalence of musculoskeletal disorders between two groups of nurses working in different departments of a hospital. The sample consisted of 100 nurses from the intensive care unit (ICU) and 100 nurses from the medical-surgical department. Data were collected by means of a questionnaire containing information about sociodemographic characteristics, work conditions, and musculoskeletal symptoms. The results showed that the prevalence of musculoskeletal disorders was higher among ICU nurses than among medical-surgical nurses. The most prevalent disorder was low back pain, followed by neck pain and shoulder pain. The results suggest that the ICU environment may be more conducive to the development of musculoskeletal disorders.
